

MT4/5 Trading Copier Manual (for MT4/5)

1、Advantages of This Copier:

- ①、Most copy-trading software on the market requires you to provide your platform name, server name, account number and trading password — they use your login credentials to run your account on their servers, which exposes all your information and offers no real security. By contrast, this copy-trading software does not collect any of those details: you can deploy it on a local PC or on a cloud host for remote copying, and no account information is ever leaked.
- ②、Most copy-trading software on the market charges monthly fees or fees based on the number of follower accounts, and often comes with various restrictions. In contrast, this copy-trading software is completely free and imposes no limits on the number of follower accounts — you can copy trades to as many as 100,000 accounts without any problem.
- ③、It supports both one-to-many and many-to-many configurations (i.e., multiple accounts can act as signal sources simultaneously) without any interference between them. You can freely assign roles, choose same-direction or reverse copying, and set proportional or multiplier-based copy ratios — all fully customizable to your needs.
- ④、There are no platform restrictions — accounts from any broker can participate in copy trading. You only need to point IP addresses to the bridge service host IP, and it will work seamlessly.
- ⑤、Anyone can deploy the bridge service on a cloud server and build their own copy-trading platform or community.
- ⑥、This software supports high concurrency — it can easily handle up to 100,000 concurrent operations per second without any performance issues.

The original design purpose of this software is to allow both one signal account to control multiple follower accounts (one-to-many) and multiple signal accounts to control multiple follower accounts (many-to-many). It supports cross-platform copying between MT4 and MT5, across different brokers, and between demo and live accounts. For traders who have written trading strategies in MQL4 but don't have the time to convert them to MQL5, this system allows you to use an MT4 account running the EA as the signal source to copy trades to MT5 accounts. Conversely, if you have an MQL5 EA but not enough time to rewrite it in MQL4, you can use an MT5 account running the EA as the signal source to copy trades to MT4 accounts. This makes it possible for an EA written for one platform to effectively operate across both platforms. The main purpose of copy trading is one-to-many replication. Following other traders' signals blindly is generally a misconception — statistically, only a tiny fraction of traders can achieve consistent long-term profitability. Relying on others' trades instead of your own strategy carries huge risks and almost always leads to account blow-ups. Important: The same account can only act as either a master or a follower, not both. If an account tries to follow itself (acting as both signal and follower), it creates an infinite feedback loop, which is meaningless and must be avoided.

In the following explanation, **MT5** is used as an example. For **MT5**, the files should be placed in

the **Services** directory. For **MT4**, the files should be placed in the **Scripts** directory. Do not occupy EA slots, since many users already use EAs for trading. Both **MT4** and **MT5** can act as **signal sources** or **followers**, and multiple accounts can serve as signal sources simultaneously.

2、Directory overview (For Windows, MT4/5)

- ①、BridgeSrv.exe: The “BridgeSrv” program can be deployed on a cloud server or a LAN host, and it must be started first.
- ②、Master: Master (Signal Source) Setup: Copy the two files into the Services directory of the signal account (located at the same level as the Experts directory).
- ③、Slave: Follower (Slave) Setup: Copy the two files into the Services directory of the follower account (located at the same level as the Experts directory).

Key Points: Install each MT4/MT5 client separately for each account, using the account name to distinguish the installation paths. This ensures that multiple accounts can be logged in simultaneously. After installation, rename each desktop shortcut to match the account name for easy identification.

- ④、Please install MSVBCRT_AllInOne first.

In short: Place the two Master files in the Services directory of the signal (master) account, and the two Slave files in the Services directory of the follower (slave) account (for MT4, use the Scripts directory). Simply copy the two files into each folder. After copying, go to the **Services** or **Scripts** section in the MT4/MT5 Navigator, right-click, and select **Refresh** to display them. All further instructions are based on this setup.

3、How to copy the files to Services Directory(MT4 is copy to Scripts), as follows:

- ①、Click IDE on MT4/5 ToolBar, wait about 3 seconds:

②、Then from the left Navigator Panel (Directory Tree), Open the corresponding directory.

If you are using an **MT4 Terminal**, copy the files from the **MT4 directory** into the **Scripts** folder, as shown below.

③、After opening the directory, copy the **two files** into it. Then close the IDE/editor window and go to the **Navigator** panel to refresh.

4、How to Add a Service in **MT5** (see the figure below):The procedure is the same for both Master and Follower accounts — add the service manually.Make sure to check “Allow DLL imports”.(For **MT4 terminals**, go to the **Scripts** in the Navigator, select the script file, right-click → **Attach to Chart**.)

If you are using **MT4**, go to **Tools → Options → Expert Advisors** and check “Allow DLL imports”, as shown in the figure below.

5、Modify the follower's **bridge server IP**, **copy direction**, **copy ratio**, and other parameters: Go to **Menu → Tools → Global Variables**. Example: IP should be in the standard four-segment format (e.g., 192.168.0.199); enter only the integer parts. If the bridge service is running on the same machine, set the IP to **127.0.0.1**.

可变	值	时间

添加(A) 删除(D)

关闭

After making changes, click Close. If the connection is lost, the service will automatically **reload the latest IP every 10 seconds** and reconnect — no restart is needed. Parameter explanations:

FollowDirection — Copy direction: 1 = same-direction copy, -1 = reverse copy.

FollowMode — Order mode: 1 = fixed lot size (default), 0 = proportional mode.

ScaleFactor — Lot multiplier used in proportional mode.

FollowFixedLots — Lot size used in fixed-lot mode.

If you want to always place orders with a fixed minimum lot size of 0.01, set FollowMode = 1 (fixed-lot mode) and then set FollowFixedLots = 0.01.

6、Make sure to enable “Algorithmic Trading”, otherwise copy trading will not work properly, as shown in the figure below.

①、First, make sure “Algorithmic Trading” on the toolbar is enabled:

②、其次在导航->服务->选择服务右键属性，“算法交易”也要启用，否则无法跟单

7、Startup Sequence:First, start the bridge service program BridgeSvr.exe.Next, start the Master (signal) account service.Finally, start the Follower (slave) account service.Wait until the following appears in the terminal: Toolbox → Experts → “xxx is running…” .

8、To avoid accidentally copying trades every time you start MT4/MT5, manually stop the service before exiting, using the “Stop” option in the right-button-menu, as shown in the figure above.

9、If you are running across multiple computers, you need to add inbound rules in the firewall of the host running the bridge service to allow port access.If your computer has a firewall, open the following four ports: 41818, 41888, 51818, 51888.If there is no firewall installed, this step is not needed.For newer versions of Windows (with built-in firewall):Go to This PC → Properties → Privacy & Security → Windows Security → Firewall & Network Protection → Advanced Settings → Inbound Rules.Right-click → New Rule → Port → TCP, and enter the specific ports: 41818,41888,51818,51888 (separated by commas).Select Allow the connection.Check Domain, Private, Public.Name the rule: Copy Trading Service, and optionally fill in the description.Click Finish.If the bridge service is running on a cloud server, the method for adding inbound/outbound rules is exactly the same.

10、Architecture Diagram

On both the Master and Slave sides, the **BridgeSvrIP** in the global variables should point to the IP

of the computer running the bridge service. The bridge service acts as the communication channel between the signal account and follower accounts — as long as all accounts point to it, they will automatically connect.

11、Supported Trading Symbols

Currently, the software has been tested to support the following **159 mainstream trading symbols**. The software itself does **not limit the number of instruments**. Different platforms may use different contract symbols with various suffixes, such as x, m, z, .s, .c, .i, .r, .G, etc. The copy-trading software can automatically adapt to these variations. The tested 159 symbols codes are as follows:

```
Symbol_0="XAUUSD"; //交易品种_0,黄金
Symbol_1="XAGUSD"; //交易品种_1,白银
Symbol_2="EURUSD"; //交易品种_2,欧美
Symbol_3="GBPUSD"; //交易品种_3,镑美
Symbol_4="AUDUSD"; //交易品种_4,澳美
Symbol_5="USDJPY"; //交易品种_5,美日

Symbol_158="USDAED";//US Dollar vs United Arab Emirates Dirham

If your follower accounts are on multiple different platforms, first ensure that the trading symbols codes are identical and tradable across those platforms, and that they are included in the 159 tested symbols above. Suffix differences between platforms do not matter, as the software can automatically adapt. Although only 159 symbols have been tested, the software does not limit the number of instruments — it can support all tradable symbols on the platform. If users require additional special features, please contact Email: 251210269@qq.com for a custom version.

Special Note:

Each account should have its own clean and independent installation of the MT4/MT5 client. Do not log in to accounts from different brokers using the same MT4/MT5 client installation. Doing so can cause multiple similar symbols for the same trading instrument to appear within the same terminal, each with different suffixes — leading to confusion. For example, you might see symbols like EURUSD, EURUSD.s, EURUSDx, EURUSDm, EURUSD.c, EURUSD-E, EURUSD-P all listed in the system's market watch. In such cases, even manual trading becomes confusing, as it's hard to tell which symbol actually belongs to your current account.

12. Follower Accounts Copy Trades from Specified Signal Source (Grouped Copying)

The previous sections described full copy scenarios, where either one signal account controls N follower accounts, or N signal accounts control M follower accounts. In these cases, all followers copy trades from all signal accounts, similar to a broadcast.

Grouped Copy Scenario

In a grouped copy scenario, followers only copy trades from specified signal sources. For example: There are three signal accounts: **A, B, C**. There are 300 follower accounts that need to be divided into three groups: The first 100 follower accounts follow **A**. The next 100 follower accounts follow **B**. The last 100 follower accounts follow **C**.

One way to implement this is to run three separate bridge service hosts and point each group of followers to the corresponding host IP. However, this approach requires three separate machines, increasing operational costs.

A more flexible solution is to support multi-signaler and multi-follower grouping within a single bridge service. Implementation Using SignalID. Each signaler and follower account has a SignalID value (an integer). To assign a follower to a specific signal source, set the SignalID of the follower to match the SignalID of the desired signal source via: Menu → Tools → Global Variables → SignalID.(**master-signal-id** on Signaler-side).

Example:

First 100 followers → SignalID = 111, A signal account → SignalID = 111

Middle 100 followers → SignalID = 222, B signal account → SignalID = 222

Last 100 followers → SignalID = 333, C signal account → SignalID = 333

13、Follower Account Copying from Multiple Signal Source IDs Simultaneously

Previously, we discussed how a follower can copy trades from a single specified SignalID. This section explains how to follow multiple signal sources at the same time. Steps: On the follower account, press F3 to open Global Variables, or go to Menu → Tools → Global Variables. Click the “Add” button. Use the following format for variable names: SignalID + number. Enter the integer part of each SignalID you want to follow. There is no limit to the number of signal sources you can add. By doing this, the follower account can simultaneously copy trades from multiple specified signal sources.

The screenshot shows the '全局变量' (Global Variables) dialog box. It contains a table with three columns: '变量' (Variable), '赋值' (Value), and '时间' (Time). The table lists several variables:

变量	赋值	时间
IP1	127	2025.08.30 14:10:34
IP2	0	2025.08.30 14:10:34
IP3	0	2025.08.30 14:10:34
IP4	1	2025.08.30 14:10:34
SignalID	1050	2025.08.31 11:52:24
SignalID1	1051	2025.08.31 11:52:19
SignalID2	1052	2025.08.31 11:52:29
SignalID3	1053	2025.08.31 11:52:37

A red arrow points from the text '格式: SignalID+序号, 不限添加个数' (Format: SignalID+number, unlimited number of additions) to the 'SignalID' row. Another red arrow points from the '添加(A)' (Add) button to the top right corner of the dialog.

格式: SignalID+序号, 不限添加个数

After adding or modifying SignalIDs, set the global variable “**SignalSubscribe**” to any non-zero value. This will immediately report the subscribed signal source IDs and take effect instantly.

14、How to let friends to copy your trades?

A. Basic Setup: Simply provide your friends with the IP of the cloud host running your Bridge Service. They only need to add the two Slave service files to their MT4/MT5 and set the BridgeSvrIP to your cloud host IP.

B. Multiple Signal Sources: If you have multiple accounts running EAs as signal sources, assign different SignalID values to each signal account. Different friends can follow different signals by setting their follower account's SignalID to match the desired signal source. Setting SignalID = 0 means the follower will copy all signal sources.

C. Large-Scale Copying for Multiple Traders: If your company has multiple professional traders, each can manage, for example, 10,000 follower accounts. Ensure that each follower account's BridgeSvrIP and SignalID match the corresponding trader's signal account.

15、Link to download for long-term-support.

- (1) <https://download.csdn.net/download/L251210269/90958775>

②、<https://github.com/linzihui/MT45TradeCopy>

Note: Each software package is an independent version. Different versions cannot be mixed or used together.

16、Recommended “Big Wins, Small Losses” Trading Strategy

First and foremost, you must mentally reject the gambler’s approach of over-leveraging a single account. Instead, adopt a one-to-many (1-to-N) setup:Keep the signal account balance small, e.g., only 10U.Let each of the N follower accounts hold larger balances, e.g., 1,000U each.How it works:Only trade on the signal account. The follower accounts simply mirror the trades.If the signal account trades correctly and profits, the N follower accounts multiply the profit N times.If the signal account hits a loss or blows up, it only loses 10 units, which means each follower account loses only 1% of its balance.This setup caps the risk at the signal account level and restrains human emotional biases.Only this method can truly achieve big wins with small losses, ensuring sustainable profitability.Otherwise, if you put all your capital into a single account, you will inevitably keep adding positions as long as there is still money left, which can lead to even bigger losses. This approach cannot overcome the weaknesses of human nature.

17、Recommended Deployment methods

①、Put only the Bridge Service on a cloud server, while keeping all signal accounts and follower accounts on LAN machines.This way, the bridge connects accounts across the network, allowing them to copy trades between each other without exposing any account passwords, ensuring maximum security.You only need to publicly share the Bridge Service host IP and the SignalID(s) of the signal accounts you wish to share.

②、Run the Bridge Service, signal accounts, and follower accounts all on a cloud server.

Currently, other copy-trading platforms typically collect the account numbers, passwords, and server info of both signal and follower accounts.This approach does not guarantee account privacy or security and is highly not recommended.It is only safe if you are using your own cloud server and all accounts are yours.

③、You can run only the Bridge Service and signal accounts on a cloud server, while keeping the follower accounts on LAN machines. The signal account can then be logged in on a mobile device or computer for trading without needing to run the service there.If the same account is logged in multiple instances, you do not need to attach the service to each instance; only the instance running on the cloud server needs to have the service active.

④、If the same account has multiple login instances running different EA strategies, only one instance needs to have the Master service attached. Orders generated by the other login instances’ EAs will be automatically synchronized through the instance with the Master service. All orders from the various EA instances share the same SignalID from that single Master-attached instance for reporting.

⑤、Running different EA strategies on different accounts as signal sources is the recommended approach.Consider this: if you use multiple login instances of the same account to run different EA strategies and assign each instance a different SignalID, it might appear to separate them. However, MT4/MT5 automatically synchronizes the order lists across all login instances of the same account. This means that each instance will report the same orders multiple times, causing the SignalID separation to lose its meaning.

Key takeaway: For multiple EA strategies, always use different accounts to maintain proper distinction. For multiple login instances of the same account, only one instance needs the service running. Other instances on computers or mobile devices do not need to run the service, since MT4/MT5 automatically synchronizes orders across all instances of that account.

18. Common Issues with the MT4 Terminal

This issue specifically applies to MT4, because only MT4 has this problem. When switching chart timeframes, MT4 will stop running Script-type programs, which causes the master to be removed and the signal source to stop functioning properly. This happens because MT4 does not support Service-type programs, and we also cannot occupy the EA slot to run the master. MT5, on the other hand, does not have this issue — since MT5 supports Service-type programs, switching timeframes does not interrupt the master service. Therefore, the recommended approach for MT4 signal source terminals is as follows: After logging into the signal source account in MT4, attach the master to a chart and keep it unchanged. Then, use another terminal instance to log into the same account for trading — for example, via a mobile terminal or another PC terminal. You can trade manually or use an EA; it doesn't matter. Since the same account can be logged in from multiple instances, only one instance needs to have the master service running.

19. One-Click Copy to Directory Tool

Run the tool directly: [CopyFilies2MT45Folder.exe](#), and click the copy button. The EA files will be automatically copied to all MT4 and MT5 directories installed on your computer, regardless of how many terminal applications you have installed. This way, the previously mentioned manual task of copying EA files to various MT4 and MT5 terminal directories is completed with a single click.
